
THEY SAW TOMORROW
A MOTION PICTURE SAGA of the SOUTHWEST
– IN NATURAL COLOR

THE PICTURE

★ FACTUALLY and dramatically this new film presents the heroic story of a people in Southern California who had the vision to see the need for a more abundant and dependable supply of the one necessity of life which the Southwest country does not freely provide—water.

It tells how they went about to solve this most difficult problem by the conquest of a wild and desolate land and by the building of the longest and largest domestic water supply line in all America.

It tells of the tremendous obstacles that stood in the way—and how these were overcome.

It is an authentic motion picture presentation of the great Colorado River Aqueduct—why it was needed—how it was planned and built—how its benefits are distributed.

It reveals how the herculean task of building the Aqueduct was finished in the summer of 1941 just in time to supply the vital needs of a strategic center of war production and military operations in a country suddenly plunged into a struggle for its very life.

It is a Saga of the Southwest.

THE AQUEDUCT

★ THE Colorado River Aqueduct is more than 400 miles in length and has the capacity ultimately to deliver one billion gallons of water a day—enough for 7,500,000 persons. It was financed and built by and for the people of The Metropolitan Water District of Southern California. From its intake on the Colorado River above Parker Dam, this giant waterway extends clear across the State of California—to each of the fourteen cities and areas within the boundaries of The Metropolitan Water District.

Construction work was started in December, 1932, and during eight years of country-wide unemployment it provided work for thousands of men. It was placed in operation in the summer of 1941—and thus was ready to deliver a plentiful and dependable water supply to a vital war production and strategic military area.
